$$S = \frac{1}{2} \left(\begin{array}{ccc} 1 + \Gamma \cos \theta & \Gamma \sin \theta & e^{-i\phi} \\ \Gamma \sin \theta & e^{i\phi} & 1 - \Gamma \cos \theta \end{array} \right)$$

a density matrix? With what conditions on r, 0, and \$?

Solution: The matrix

has unit trace
$$tr S = \frac{1}{2}(1+r\cos\theta)$$

 $+\frac{1}{2}(1-r\cos\theta) = 1$

but is it non-negative? Let's calculate its eigenvalues

$$\det\left(3-\lambda 1\right) = \left(\frac{1}{2}(1+r\cos\theta)-\lambda\right)\left(\frac{1}{2}(1-r\cos\theta)-\lambda\right)$$

$$-\frac{1}{4}r^{2}\sin^{2}\theta = 0$$

$$\frac{1}{4}-\lambda+\lambda^{2} = \frac{1}{4}r^{2}\cos^{2}\theta - \frac{1}{4}r^{2}\sin^{2}\theta = 0$$

$$\frac{1}{4}-\lambda+\lambda^{2} = \frac{1}{4}r^{2} = 0$$

$$\rightarrow \lambda = \frac{1}{2}(1\pm r)$$

8 is non-negative if both eigenvalues are non-negative. Therefore, 8 is a density matrix if $r \leq 1$, with no conditions on θ and ϕ .

The GHZ state is a maximally entangled state on 3 qubits

It can be prepared with a circuit

Solution:

$$S_{AB} = +r_{c} |GHZ> \langle GHZ|$$

$$= (1_{AB} \circ (1 \circ)) S_{ABc} (1_{AB} \circ (0))$$

$$+ (1_{AB} \circ (0 \circ)) S_{ABc} (1_{AB} \circ (0))$$

$$+ (1_{AB} \circ (0 \circ)) S_{ABc} (1_{AB} \circ (0))$$

$$=\frac{1}{2}\begin{pmatrix}1&0&0&0\\0&0&0&0\\0&0&0&0\\0&0&0&0\end{pmatrix}+\frac{1}{2}\begin{pmatrix}0&0&0&0\\0&0&0&0\\0&0&0&0\\0&0&0&1\end{pmatrix}$$

$$=\frac{1}{2}\begin{pmatrix}1&0&0&0\\0&0&0&0\\0&0&0&0\\0&0&0&1\end{pmatrix}.$$

$$S_{A} = \left(\begin{array}{c} 1 \\ A & (1 & 0) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 & 1) \end{array} \right) S_{AB} \left(\begin{array}{c} 1 \\ A & (0 &$$

Notice that $S(g_A) = 1$, so each qubit in the GHZ state is maximally entangled with the other two.

Sometimes useful trick:

If A is a nxn matrix, then $tr(A) = \lambda_1 + \lambda_2 + \dots + \lambda_n$ $tr(A^2) = \lambda_1^2 + \lambda_2^2 + \dots + \lambda_n^2$ \vdots $tr(A^n) = \lambda_1^n + \lambda_2^n + \dots + \lambda_n^n$

where λ_i are the eigenvalues of A. Then all eigenvalues can be reconstructed if tr (A), tr (A²), ..., tr (Aⁿ) are known.

Example: Consider the Hadamard matrix

$$H = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}.$$

Compute tr(H) and tr (H2). Then find the eigenvalues of H.

Solution: tr(H) = 0 $tr(H^2) = tr(A) = 2$

The eigenvalues satisfy

$$\begin{cases} \lambda_1 + \lambda_2 = 0 \\ \lambda_1^2 + \lambda_2^2 = 2 \end{cases} \qquad \Rightarrow \qquad \begin{cases} \lambda_1 = 1 \\ \lambda_2 = -1 \end{cases}$$

Example: Let 32 be the second Pauli matrix. Then

$$2_{2} \otimes 2_{2} = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} \otimes \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ -1 & 0 & 0 & 0 \end{pmatrix}$$

- a) Find the normalized state (YER)

 1747 = e 1832032

 1007
- b) Find the values of 8 such that 123 is a product state.

Solution:

a) From the first exercise problem set we know that

Therefore,
$$|w\rangle = e^{i\delta \delta_2 \omega \delta_2} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} = \begin{pmatrix} \cos \delta \\ 0 \\ -i \sin \delta \end{pmatrix}.$$

b) Product states of two qubits are of the form

$$\begin{pmatrix} a \\ b \end{pmatrix} \otimes \begin{pmatrix} c \\ d \end{pmatrix} = \begin{pmatrix} a & c \\ a & d \\ b & c \\ b & d \end{pmatrix}$$

So, if 12es is a product state, then

for some a,b,c,d. Notice that either a = 0 or d = 0 since ad = 0. Therefore both cost and -i sint cannot be non-zero.

$$\rightarrow$$
 $\gamma = 0$ or $\gamma = \frac{\pi}{2}$

and

$$\gamma = 0$$
: $\langle \gamma \rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \otimes \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \langle 0 \rangle$

$$V = \frac{\pi}{2}$$
: $|\mathcal{P}\rangle = \begin{pmatrix} 0 \\ 1 \end{pmatrix} \otimes \begin{pmatrix} 0 \\ 1 \end{pmatrix} = |111\rangle$

up to a global phase.
